

Business Requirements Document (BRD)

Project Name: RBI Sectoral Credit Allocation & Financial Performance Dashboard

Author: Mona Jasuja (Business Analyst - Data & Analytics)

Stakeholders: Commercial Credit Risk Team, Regulatory Compliance Division

Version: 1.1

1. Background & Business Problem

Our risk management teams currently monitor sector-specific credit exposure by manually analysing public datasets from the Reserve Bank of India (RBI). The current process creates major bottlenecks: analysing multi-year trends is highly manual, and normalizing volume metrics against percentage growth scales frequently delays executive updates.

Proposed Solution

We aim to automate this pipeline by centralizing public RBI data downloads into a single source of truth database model. This backend will directly power an interactive corporate **Tableau Dashboard** (RBI_ANALYTICS_MONA), allowing risk officers to instantly evaluate historical trends, monitor risk concentrations, and isolate credit shifts spanning **2018 through 2026**.

2. Targeted User Personas

- **Credit Risk Management Team:** Needs high-level visual tools to track absolute credit allocation, monitor growth velocities, and identify top sector exposure.
- **Regulatory Compliance Officers:** Requires dedicated visual segmentation to audit mandated regulatory allocations (Priority Sector) against standard commercial lending.

3. Project Scope

In-Scope

- Consolidating 9 years (2018–2026) of historical, public RBI sectoral credit deployment data.
- Transforming numeric year dimensions into standardized, continuous chronological timelines.
- Building a backend Star Schema supporting cross-filtering across dynamic financial metrics.
- Delivering a single-page interactive Tableau dashboard visualizing volumes alongside growth rates.

Out-of-Scope

- Ingesting internal customer account records or private, proprietary bank details.
- Implementing live data streaming updates (the engine functions entirely on static batch extracts).

4. Functional & Reporting Specifications (Dashboard Alignment)

[FS-1] Core Key Performance Indicators (KPIs)

The front-end interface must explicitly display two high-level summary cards at the top of the canvas to give executives immediate context:

- **Total Credit Allocation:** A centralized card summarizing global absolute credit volume (expressed as a simplified decimal aggregate, e.g., 1.95B).
- **Total Sector Count:** A distinct card displaying a unique distinct count of all reporting macro and micro sectors currently loaded into the view (e.g., 47).

[FS-2] Visual Chart Modules

To resolve the core challenge of monitoring volumes alongside rate variations, the dashboard must implement three dedicated visualization quadrants:

- **Dynamic Performance Matrix:** A high-level matrix table mapping granular reporting timeline indicators (columns: 2018 through 2026) against primary item/sector rows. Cells must display aggregate duration metrics to identify reporting gaps or sample counts across the timeline.
- **Dual-Axis Trend Analysis (Volume vs. YoY Growth):** A combined line and bar timeline visualization mapping historical patterns.
 - *Primary Axis (Bars):* Absolute credit distribution volumes (expressed in millions/INR Crores).
 - *Secondary Axis (Line):* Corresponding Year-over-Year (YoY) percentage changes to immediately call out sudden spikes or drop-offs (e.g., historical dips down to -84.2%).
- **Horizontal Rankings:** A horizontal bar chart mapping specific credit breakdowns by sector to quickly identify concentration risk without layout crowding.

[FS-3] User Interface Interactivity & Global Filters

To accommodate quick data manipulation, the dashboard must feature a dedicated right-hand interactive panel containing three specific controls:

- **Matrix View Parameters (Dynamic Sizing):** A radio-button parameter toggle allowing users to instantly dynamically restrict the layout to show **All Sectors**, **Top 5**, or **Bottom 5** data buckets.
- **Lending Type Filter (Category Extraction):** A global checkbox filter utilizing string-matching logic to let compliance teams toggle the view between **Commercial/Non-Priority** lending and **Priority Sector** classifications.
- **Sector Breakdown Rank Restriction:** The horizontal ranking chart must natively restrict itself to a **Top 10** view by default to keep the interface highly scannable.

-
- **Cross-Filtering:** Selecting any specific item row or dimension attribute in any module must instantly isolate that sub-segment across all other active visual elements on the canvas.

5. Non-Functional Specifications

- **Query Performance:** The presentation layer must run queries against optimized database View layers instead of raw processing tables to reduce dashboard rendering delays on Tableau Public.
- **Layout Consistency:** The canvas layout must utilize a fixed, standard dashboard resolution to guarantee perfect visual stability and prevent structural clipping across standard corporate desktop and laptop contexts.
- **Data Security & Origin:** The platform will handle publicly available macroeconomic data exclusively. No proprietary or confidential data can be used within this environment.
