

Business Requirements Document (BRD)

Project Name: RBI Sectoral Credit & GDP Performance Dashboard

Created By: Mona Jasuja (Student / Junior BA)

Project Goal: Turn messy Reserve Bank of India (RBI) spreadsheets into an easy-to-use, two-page Tableau dashboard.

1. The Problem Statement

Every year, the Reserve Bank of India (RBI) releases important public tables about loans and investments. Our internal risk teams need to look at this data to make smart business decisions. However, using the raw files creates three big problems:

- **The data is disconnected:** The RBI releases data in separate tables. It is very hard for our team to connect these tables together to see a clean 9-year trend from **2018 to 2026**.
- **The numbers use different scales (The Apples-to-Oranges Trap):** A single table mixes different kinds of metrics. Half of the table shows data based on a **% of Bank Deposits**, while the other half changes mid-way to show a **% of the Country's GDP**. Plotting these together on one chart looks completely broken and confusing.
- **Too much slow manual work:** Analysts waste hours cutting, pasting, and formatting these columns in Excel. By the time leadership sees the final charts, the information is already old.

The Proposed Solution

I have built a clean database model to organize this messy data. This data directly feeds into a **two-page interactive Tableau Dashboard (RBI_ANALYTICS_MONA)**. It automatically splits the conflicting numbers so managers can get visual answers in just 5 seconds.

2. User Personas

- **The Credit Risk Team:** They need a clean visual page to quickly see exactly which industries have the most bank debt.
 - **The Regulatory Compliance Officers:** They need an easy way to check government-mandated loans (**Priority Sector Lending**) against regular commercial bank lending.
-

3. Project Scope

In-Scope

- Cleaned 9 years of historical annual RBI credit and asset data.

- Fixed messy data columns using custom **Calculated Fields** in Tableau to separate the numbers.
- Created a twin-dashboard setup with an easy **Top Navigation Bar** so users can switch pages with one click.

Out-of-Scope

- No private or confidential customer bank account data is used (this uses 100% public data).
 - No real-time live data streaming (the dashboard updates via manual batch uploads when new data comes out).
 - No advanced machine learning or predictive forecasting models.
-

4. The Final Dashboard Setup

To fix the data split problem, I built **two completely separate dashboard pages** inside one Tableau workbook:

Page 1: The Banking Operations View

This page focuses strictly on internal bank health metrics, calculated as a **% of Aggregate Deposits**.

- **KPI Summary Cards:** Big text boxes at the top showing the total credit value (**1.95B**) and the total unique sectors tracked (**47**).
- **Main Charts:**
 - A chart combining absolute loan volumes (Bars) alongside yearly growth rates (Line) on one screen.
 - A master **Data Matrix Table** at the bottom to check how many data rows exist for each sector every year.

Page 2: The Macroeconomic GDP View

This page looks outward at the country's economy, tracking metrics calculated as a **% of GDP**.

- **KPI Summary Card:** A large-font scorecard displaying the average credit-to-GDP trend line baseline (**54.61%**).
- **Main Charts:**
 - Two separate clean line/bar charts tracking **Credit to GDP %** and **Total Investments to GDP %** over time.
 - A **Priority Sector Lending (PSL) Pie Chart** that splits government-targeted loans (**0.11B**) away from commercial loans (**1.84B**).

- A clean **Reporting Frequency Matrix** to check data health.

Interactive Dashboard Controls

- **Top Navigation Banner:** A dark corporate button at the top center ("**CLICK FOR BANKING OPERATIONS VIEW**") that lets users jump between Page 1 and Page 2 instantly.
 - **Right-Hand Filter Column:** A global control panel where users can use checkboxes to toggle between **Commercial** and **Priority Sector** data across the entire workbook.
-

5. Non-Functional System Requirements

- **Fast Loading Times:** The charts must run quickly on Tableau Public without lagging.
- **Fixed Canvas Layout:** The dashboard size is locked to a fixed size so it looks perfect on corporate laptop screens without cutting off visual text elements.
- **Data Security:** This project uses public macroeconomic numbers exclusively. No private data is allowed.
